```
public class Contact
{
    public Contact()
    {
        Addresses = new List<Address>();
    }
    public int ContactId { get; set; }
    public string FirstName { get; set; }
    public string LastName { get; set; }
    public string Title { get; set; }
    public DateTime AddDate { get; set; }
    public DateTime ModifiedDate { get; set; }
    private string Gender { get; set; }
    public ICollection<Address> Addresses { get; set; }
}
```

Summary

- Use Model First approach for new apps with no database
- EDM Designer allows you to build intelligent models
- Iterative design enables you to update model if database is modified
